

PRACTICAL – 1

AIM: Introduction to CISCO Packet Tracer software.

1. Use different types of devices like pc, switches, cables, pc with wireless card.
2. Create basic topologies and assign IP address, subnet mask, DNS, gateway IP address.
3. Test connectivity with ping command.

Introduction:

Cisco Packet Tracer is a powerful network simulation software developed by Cisco Systems. It allows users to design, build, and test network configurations in a virtual environment without the need for physical hardware. It is widely used by students, educators, and professionals for learning networking concepts, practicing Cisco commands, and preparing for certifications like CCNA.

Packet Tracer provides a drag-and-drop interface to connect and configure devices such as routers, switches, PCs, laptops, servers, and more. It supports both wired and wireless networking, giving users a complete environment to simulate real-world networking scenarios.

What is a Network Topology?

A network topology refers to the physical or logical layout of a computer network. It defines how different devices (like computers, switches, routers, etc.) are connected and how data flows between them.

Types of Network Topologies:

1. Bus Topology
 - All devices are connected to a single central cable (backbone).
 - Data travels in both directions on the cable.
 - Simple and cheap but not reliable (if the cable fails, the whole network goes down).

202044501 - COMPUTER NETWORKS

Testing Connectivity:

```
Packet Tracer PC Command Line 1.0
PC>ping 10.0.0.2

Pinging 10.0.0.2 with 32 bytes of data:

Reply from 10.0.0.2: bytes=32 time=156ms TTL=128
Reply from 10.0.0.2: bytes=32 time=93ms TTL=128
Reply from 10.0.0.2: bytes=32 time=94ms TTL=128
Reply from 10.0.0.2: bytes=32 time=93ms TTL=128

Ping statistics for 10.0.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 93ms, Maximum = 156ms, Average = 109ms
```

2. Star Topology

- All devices are connected to a central device like a switch or hub.
- Most commonly used in LANs.
- Easy to manage and troubleshoot.
- If the central switch fails, the whole network is affected.

3. Ring Topology

- Each device is connected to exactly two others, forming a circular path.
- Data travels in one direction (or both in a dual ring).
- Less used today because it's difficult to reconfigure or add devices.

202044501 - COMPUTER NETWORKS

4. Mesh Topology

- Every device is connected to every other device.
- Provides high redundancy and fault tolerance.
- Used in critical environments but is expensive to implement.

202044501 - COMPUTER NETWORKS

5. Hybrid Topology

- Combines two or more different types of topologies.
- Flexible and reliable depending on how it's designed.

PRACTICAL – 2

AIM:

→1. To identify the class of given IP address in dotted decimal notation.

Code:-

```
address of your pc:")
first_term=int(ip.split('.')[0])
print("your ip address = input("enter the ip address first term:",first_term)
if 0<=first_term<=127:
    print("your pc's ip address of class A")
elif 128<=first_term<=191:
    print("your pc's ip address of class B")
elif 192<=first_term<=223:
    print("your pc's ip address of class C")
elif 224<=first_term<=239:
    print("your pc's ip address of class D")
elif 240<=first_term<=255:
    print("your pc's ip address of class E")
else:
    print("ip address out of range.")
```

Output:-

```
enter the ip address of your pc:10.0.0.81
your ip address first term: 10
your pc's ip address of class A
```

→2. To Find First address, Last address, and No. of address of given IP address in dotted decimal notation with network mask specified using CIDR notation.

Code:-

PRACTICAL – 3

AIM: Study of various networking commands in Windows.

Common Networking Commands

1. ipconfig

- Displays the current IP configuration of the machine.
- Usage: ipconfig /all to show detailed Info.

```
PS C:\Users\admin> ipconfig /all

Windows IP Configuration

Host Name . . . . . : OSLAB-34
Primary Dns Suffix . . . . . :
Node Type . . . . . : Hybrid
IP Routing Enabled. . . . . : No
WINS Proxy Enabled. . . . . : No
```

2. ping

- Tests connectivity to a remote host by sending ICMP echo requests.
- Usage: ping google.com

```
PS C:\Users\admin> ping google.com

Pinging google.com [142.251.42.14] with 32 bytes of data:
Reply from 142.251.42.14: bytes=32 time=13ms TTL=117
Reply from 142.251.42.14: bytes=32 time=13ms TTL=117
Reply from 142.251.42.14: bytes=32 time=13ms TTL=117
Reply from 142.251.42.14: bytes=32 time=12ms TTL=117
```

3. tracert

- Traces the route packets take to reach a network host.
- Usage: tracert google.com

```
PS C:\Users\admin> tracert google.com

Tracing route to google.com [142.251.42.14]
over a maximum of 30 hops:

  1  <1 ms  <1 ms  <1 ms  10.0.0.1
  2  <1 ms  <1 ms  <1 ms  202.129.241.233
  3  <1 ms  1 ms   <1 ms  202.129.240.1
  4  1 ms   1 ms   1 ms   202.129.241.246
  5  1 ms   1 ms   <1 ms  202.129.241.254
  6  14 ms  13 ms  12 ms  103.27.170.10
  7  14 ms  13 ms  13 ms  72.14.239.103
  8  14 ms  13 ms  13 ms  209.85.250.139
  9  13 ms  13 ms  13 ms  bom12s19-in-f14.1e100.net [142.251.42.14]

Trace complete.
```

4. netstat

- Displays active TCP connections, ports on which the computer is listening, and routing tables.
- Usage: netstat -an

```
PS C:\Users\admin> netstat -an

Active Connections

Proto Local Address           Foreign Address         State
TCP   0.0.0.0:135              0.0.0.0:0               LISTENING
TCP   0.0.0.0:445              0.0.0.0:0               LISTENING
TCP   0.0.0.0:5040             0.0.0.0:0               LISTENING
TCP   0.0.0.0:7680             0.0.0.0:0               LISTENING
```

5. nslookup

- Queries DNS to obtain domain name or IP address mapping.
- Usage: nslookup google.com

```
PS C:\Users\admin> nslookup google.com

Server:  UnKnown
Address:  10.0.0.1

Non-authoritative answer:
Name:     google.com
Addresses: 2404:6800:4009:82f::200e
          142.251.42.14
```

202044501 - COMPUTER NETWORKS

6. arp

- Displays and modifies the ARP cache, which maps IP addresses to MAC addresses.
- Usage: arp -a

```
PS C:\Users\admin> arp -a

Interface: 192.168.56.1 --- 0xb
Internet Address      Physical Address      Type
192.168.56.255        ff-ff-ff-ff-ff-ff    static
224.0.0.22            01-00-5e-00-00-16    static
224.0.0.251           01-00-5e-00-00-fb    static
224.0.0.252           01-00-5e-00-00-fc    static
239.255.255.250       01-00-5e-7f-ff-fa    static
```

7. netsh

- A powerful utility to display or modify network configurations.
- Usage: netsh interface ip show config

```
PS C:\Users\admin> netsh interface ip show config

Configuration for interface "Ethernet"
DHCP enabled:                        No
IP Address:                          10.0.1.184
Subnet Prefix:                       10.0.0.0/22 (mask 255.255.252.0)
Default Gateway:                     10.0.0.1
Gateway Metric:                      256
InterfaceMetric:                     25
Statically Configured DNS Servers:   10.0.0.1
                                      8.8.8.8
Register with which suffix:          Primary only
Statically Configured WINS Servers:  None
```

8. route

- Displays or modifies the IP routing table.
- Usage: route print

```
PS C:\Users\admin> route print

=====
Interface List
17...c0 25 a5 a8 03 5c .....Intel(R) Ethernet Connection (14) I219-LM
11...0a 00 27 00 00 0b .....VirtualBox Host-Only Ethernet Adapter
1.....Software Loopback Interface 1
=====
```

9. getmac

- Displays the MAC addresses for network interfaces.
- Usage: getmac

```
PS C:\Users\admin> getmac

Physical Address      Transport Name
=====
C0-25-A5-A8-03-5C    \Device\NPF{CB1DFAB3-D560-4B6F-9F00-415FD3065195}
0A-00-27-00-00-0B    \Device\NPF{A77146EC-1CF2-45F5-9562-EE537BE75008}
```

10. hostname

- Displays the current computer's hostname.
- Usage: hostname

```
PS C:\Users\admin> hostname
OSLAB-34
```

PRACTICAL – 4

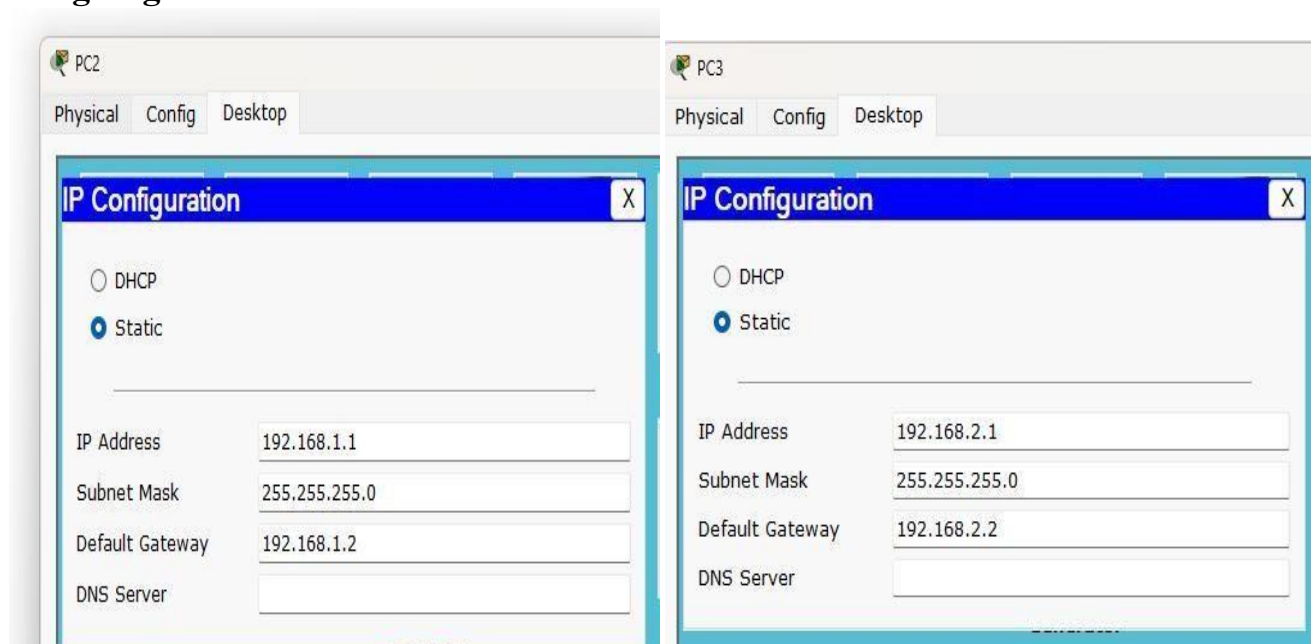

AIM:- Introduction to Default & Static Routing and Configuring the same in CISCO packet tracer.

Introduction of static routing:-

Static routing is a method of routing where network routes are manually configured and entered into a router's routing table by a network administrator. Unlike dynamic routing, which automatically adjusts routes based on network changes, static routing requires manual updates whenever the network topology changes. It is simple to implement and is often used in smaller or more stable networks where route changes are infrequent. Static routes provide greater control and security because the paths are fixed and predictable, but they lack the flexibility and scalability of dynamic routing protocols.

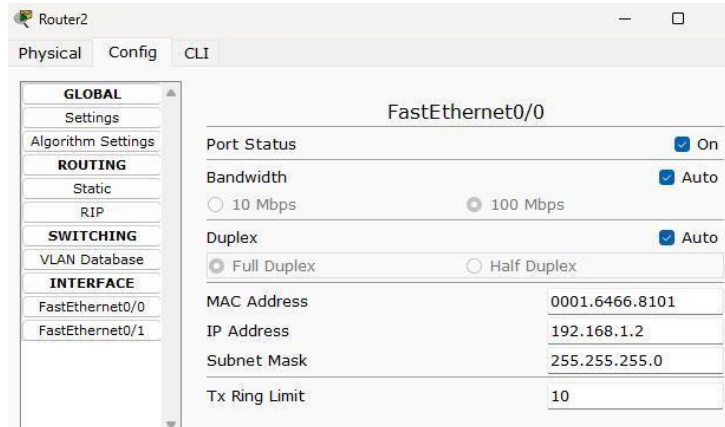

Assigning IP address to the PC'S:-

PC	IP Address	Subnet Mask	Default Gateway	DNS Server
PC2	192.168.1.1	255.255.255.0	192.168.1.2	
PC3	192.168.2.1	255.255.255.0	192.168.2.2	

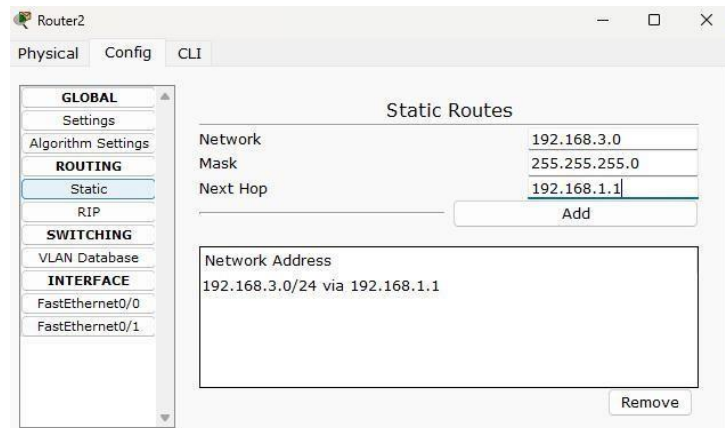

Assigning IP address to the Router:-

The screenshot shows the configuration window for the FastEthernet0/0 interface on Router2. The left sidebar has a tree view with categories: GLOBAL, ROUTING, SWITCHING, and INTERFACE. Under INTERFACE, FastEthernet0/0 is selected. The main area shows the following configuration:

Port Status	<input checked="" type="checkbox"/> On
Bandwidth	<input checked="" type="checkbox"/> Auto
Duplex	<input checked="" type="checkbox"/> Auto
MAC Address	0001.6466.8101
IP Address	192.168.1.2
Subnet Mask	255.255.255.0
Tx Ring Limit	10

Assigning IP address to the Router for static Routing:-

The screenshot shows the configuration window for Static Routes on Router2. The left sidebar has a tree view with categories: GLOBAL, ROUTING, SWITCHING, and INTERFACE. Under ROUTING, Static is selected. The main area shows the following configuration:

Network	192.168.3.0
Mask	255.255.255.0
Next Hop	192.168.1.1
<input type="button" value="Add"/>	

Below the input fields, a list of static routes is shown:

Network Address	192.168.3.0/24 via 192.168.1.1
<input type="button" value="Remove"/>	

Output:-

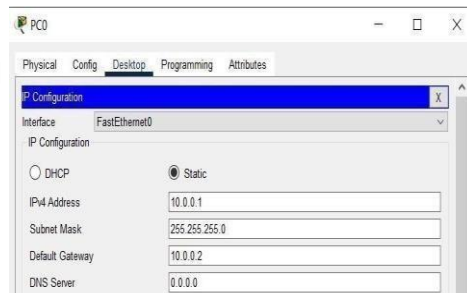

Fire	Last Status	Source	Destination	Type	Color	Time (sec)	Periodic	Num	Edit	Delete
	Successful	PC2	Router2	ICMP		0.000	N	0	(edit)	(delete)
	Successful	PC3	Router3	ICMP		0.000	N	1	(edit)	(delete)
	Successful	Router2	Router3	ICMP		0.000	N	2	(edit)	(delete)

PRACTICAL – 5

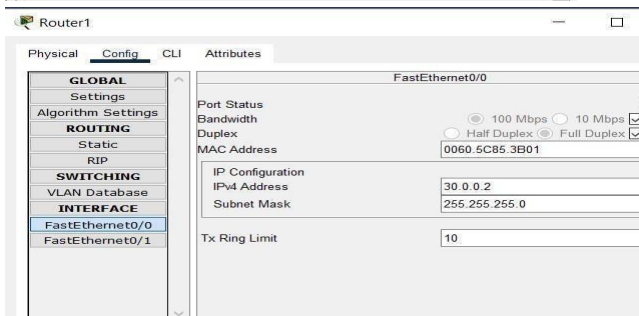

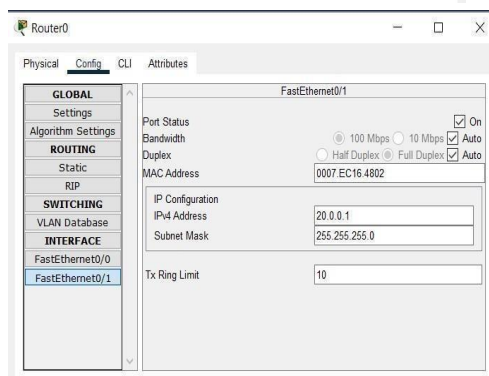

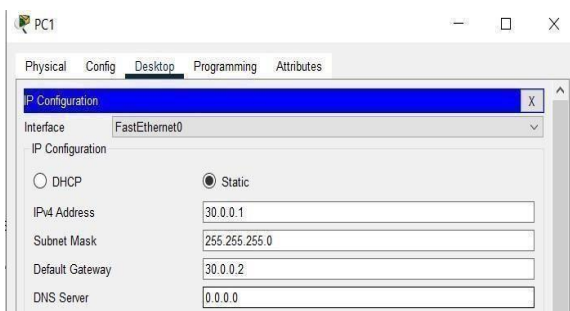

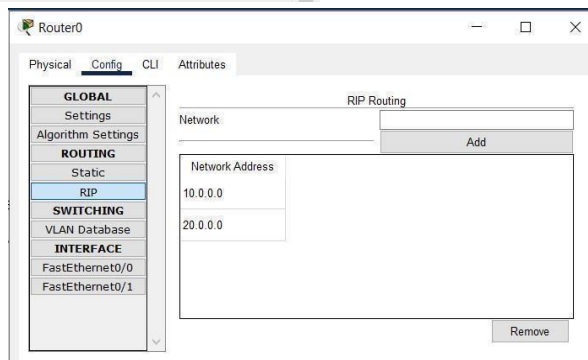

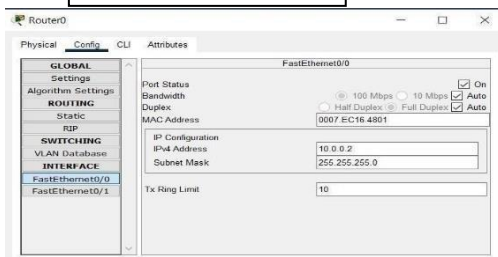

AIM:- Introduction to Dynamic Routing and configuring RIP and OSPF in CISCO packet tracer.

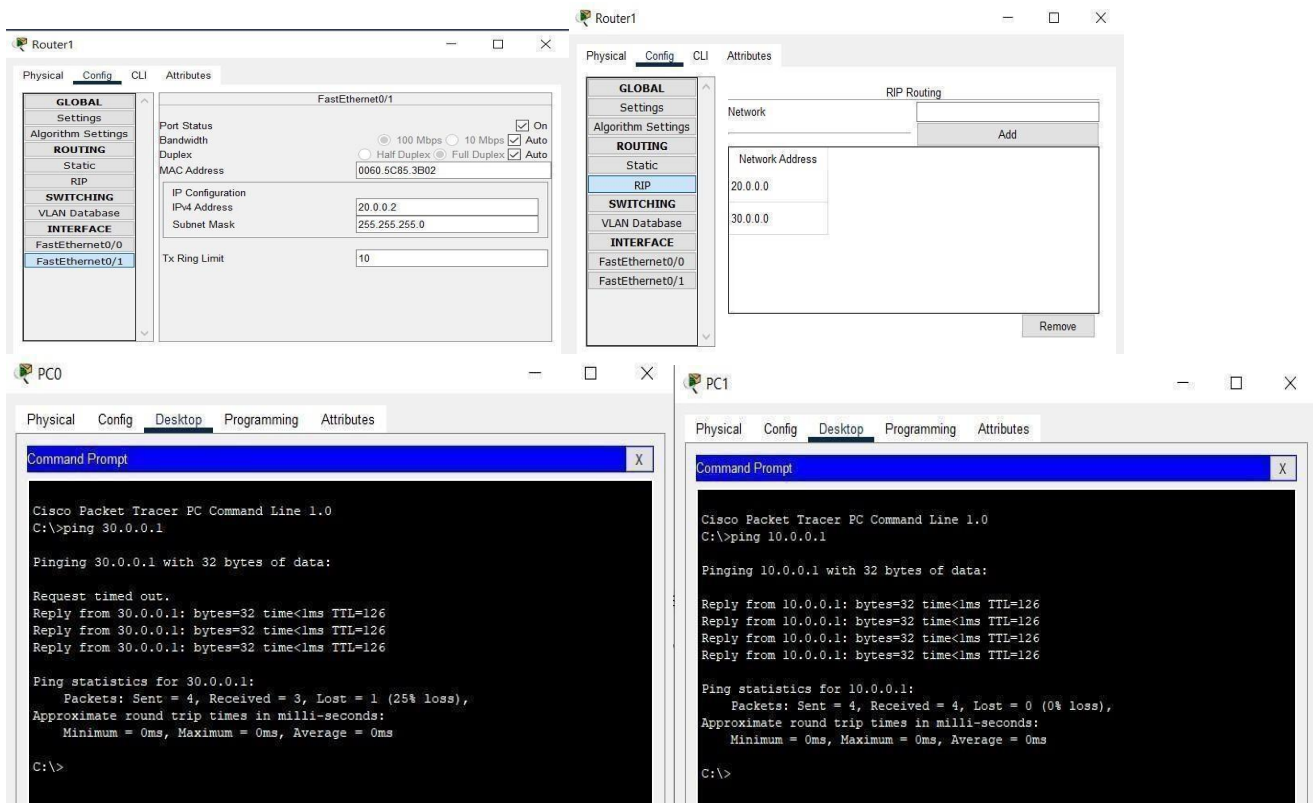

RIP:

- **Definition:** RIP is a distance-vector routing protocol that uses hop count as its metric.
- **Functionality:** RIP exchanges routing information between neighboring routers to determine the best paths to destinations.
- **Characteristics:** RIP has a maximum hop count of 15, uses UDP as its transport protocol, and has a routing update interval of 30 seconds.
- **Advantages:** RIP is simple to configure and suitable for small networks
- **Disadvantages:** RIP has slow convergence, limited scalability, and is prone to routing loops

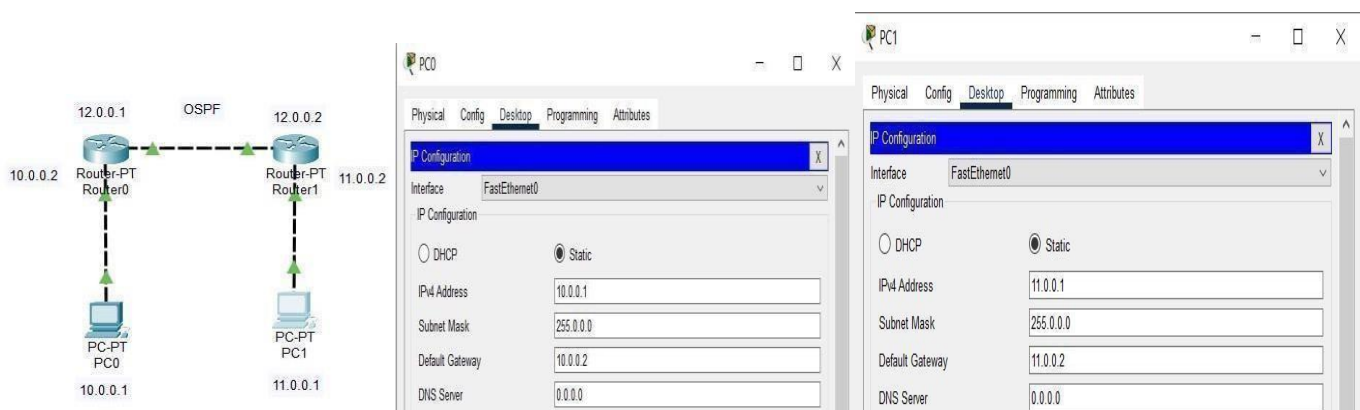

Shikhaa Shah
(12302040701165)

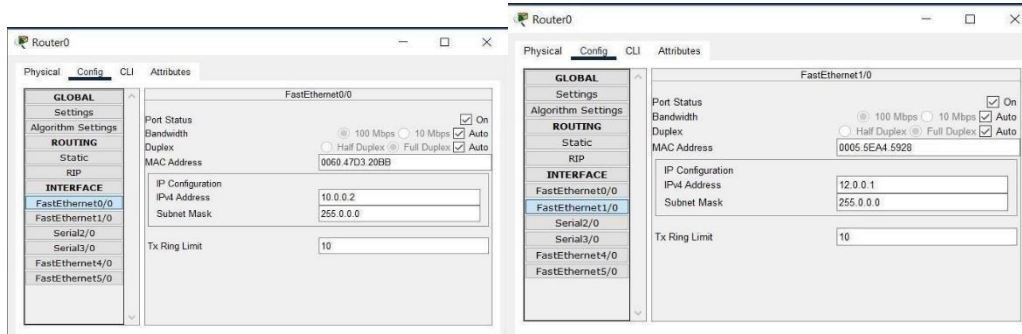

OSPF:

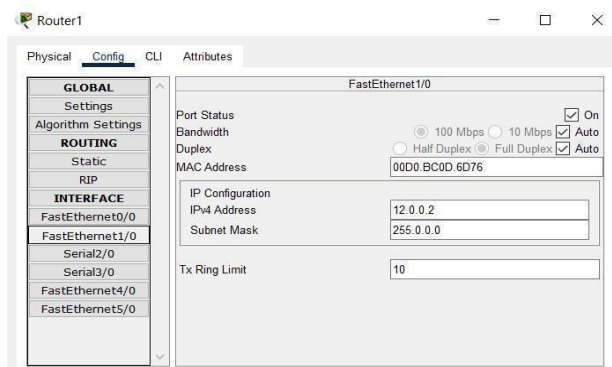

- **Definition:** OSPF is a link-state routing protocol that uses the shortest path first algorithm to determine the best paths to destinations.
- **Functionality:** OSPF exchanges link-state advertisements to build a topological map of the network.
- **Characteristics:** OSPF supports variable-length subnet masks, route summarization, and has fast convergence.
- **Advantages:** OSPF is highly scalable, provides fast convergence, and supports large networks.
- **Disadvantages:** OSPF is complex to configure and requires more resources than RIP.

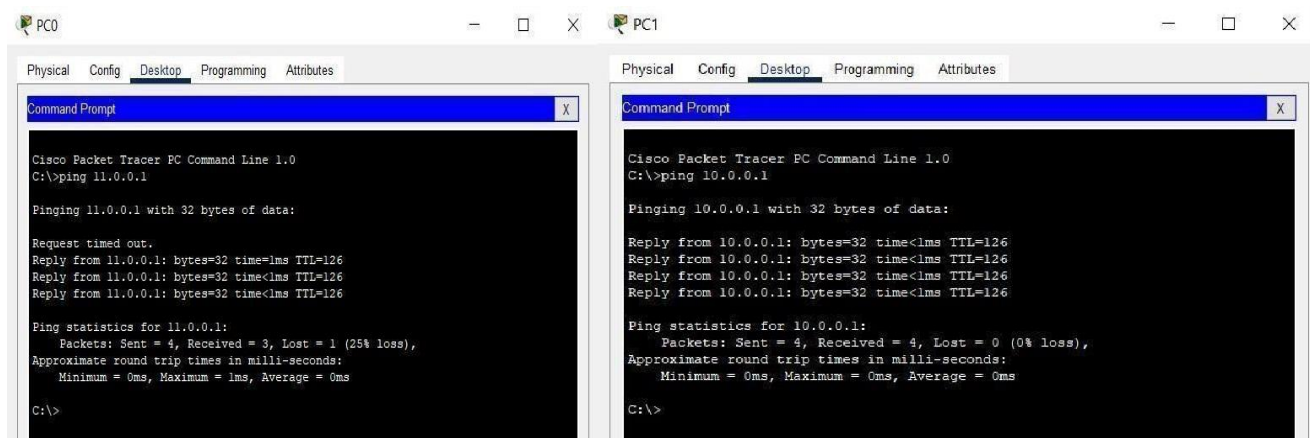

Shikhaa Shah
(12302040701165)

```
Router#en
Router#config t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#router ospf 1
Router(config-router)#network 12.0.0.0 255.0.0.0 area 0
Router(config-router)#network 10.0.0.0 255.0.0.0 area 2
Router(config-router)#
```

```
Router>en
Router#config t
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#router ospf 1
Router(config-router)#network 12.0.0.0 255.0.0.0 area 0

Router(config-router)#
```

202044501 - COMPUTER NETWORKS

PRACTICAL – 6

AIM:- Configure DHCP and DNS Server in CISCO packet tracer.

Configuring DHCP server on a Router:-

1. Build the network topology:

Shikhaa Shah
(12302040701165)

2. On the router, configure *interface fa0/0* to act as the default gateway for our LAN.

```
Router>enable Router#config terminal Router(config)# int fa0/0
Router(config-if)#ip add 192.168.1.1
255.255.255.0 Router(config-if)#no shutdown
Router(config-if)#exit
```

3. Configure DHCP server on the Router. In the server we will define a DHCP pool of IP addresses to be assigned to hosts, a Default gateway for the LAN and a DNS Server.

```
Router(config)#
Router(config)#ip dhcp pool MY_LAN
Router(dhcp-config)#network 192.168.1.0 255.255.255.0
Router(dhcp-config)#default-router 192.168.1.1
Router(dhcp-config)#dns-server 192.168.1.10
```

We can add `ip dhcp excluded-address` command to our configuration so as to configure the router to exclude addresses 192.168.1.1 through 192.168.1.10 when assigning addresses to clients. The `ip dhcp excluded-address` command may be used to reserve addresses that are statically assigned to key hosts.

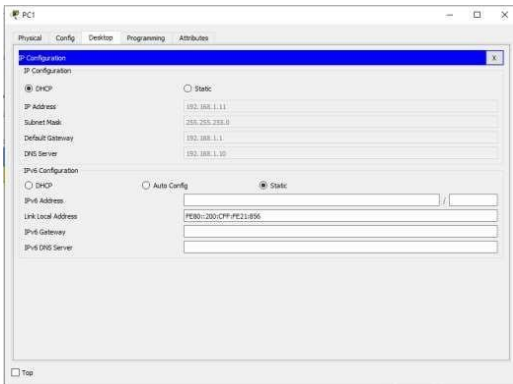

So add the above command under the global configuration mode. `Router(config)#ip dhcp excluded-address 192.168.1.1 192.168.1.10.`

4. Now go to every PC and on their IP configuration tabs, enable DHCP. Every PC should be able to obtain an IP address, default gateway and DNS server, as defined in step 2.

For example, to enable DHCP on PC1:

Click PC1->Desktop->IP configuration. Then enable DHCP:

202044501 - COMPUTER NETWORKS

Do this for the other PCs.

You can test the configuration by pinging PC2 from PC1. Ping should succeed.

Now let's do the same thing using a Generic server in place of a router: Configuring DHCP service on a generic server in Packet Tracer.

1. Build the network topology in packet tracer .

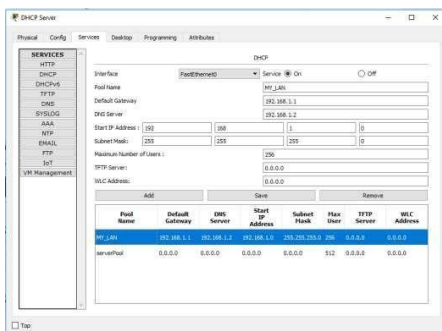

Shikhaa Shah
(12302040701165)

2. Configure static IP address on the server (192.168.1.2/24).
3. Now configure DHCP service on the generic server.
To do this, click on the server, then click on Services tab. You will pick DHCP on the menu. Then proceed to define the DHCP network parameters as follows:

Pool name:
MY_LAN
Default
Gateway:
192.168.1.1
DNS Server: 192.168.1.2
Start IP
Address:
192.168.1.0
Subnet Mask:

255.255.255.0 Maximum Number of users: 256 Click on add then Save. The DHCP entry is included in the list. Here are the configurations.

on the server:

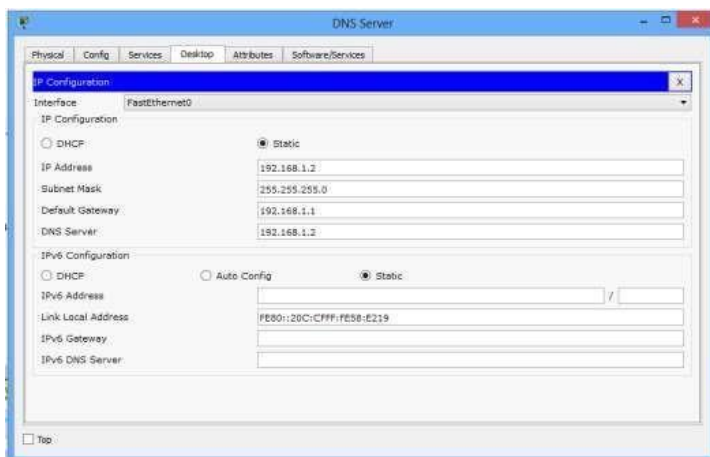

Once you've configured everything, turn ON the DHCP service.

Finally, enable DHCP configuration on each PC. The three PCs should get automatically configured. As an example, here is the DHCP configuration on PC1:

Shikhaa Shah
(12302040701165)

1. Configure static IP addresses on the PCs and the server. Server:- IP address: 192.168.1.2 Subnet mask: 255.255.255.0 Default gateway: 192.168.1.1
DNS Server: 192.168.1.2

PC0

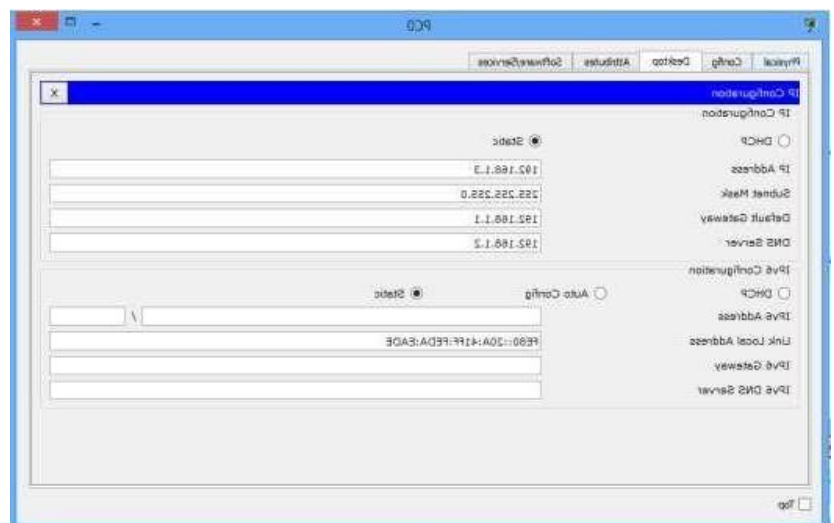

IP add: 192.168.1.3 Subnet mask: 255.255.255.0

Default gateway: 192.168.1.1 DNS server: 192.168.1.2

PC1

IP address: 192.168.1.4 Subnet mask: 255.255.255.0

Default gateway: 192.168.1.1 DNS Server: 192.168.1.2

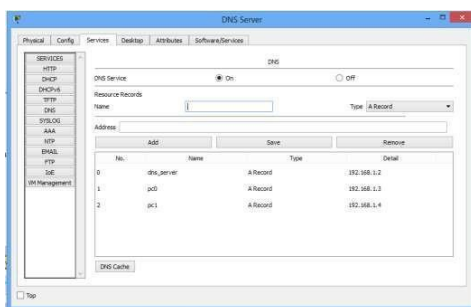

2. Configure DNS service on the generic server.

To do this, click on the server, then Click on **Services** tab. Click on **DNS server** from the menu. First turn **ON** the DNS service, then define **names** of the hosts and their corresponding **IP addresses**.

For example, to specify the DNS entry for PC0: In the **name** and **address** fields, type:

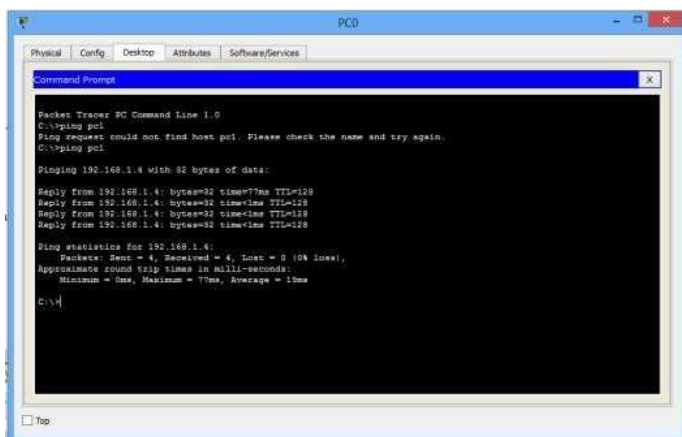

Name: PC0 Address: 192.168.1.3

Click on add then save. Repeat this for the PC1 and the server. Once you're done, your DNS entries will look like this:

Finally,

Test **domain name – IP resolution**. Ping the hosts from one another using their names instead of their IP addresses. If the DNS service is turned on and all IP configurations are okay, then ping should work.

202044501 - COMPUTER NETWORKS

PRACTICAL – 7

AIM:- Configure Web Server and FTP Server in CISCO packet tracer.

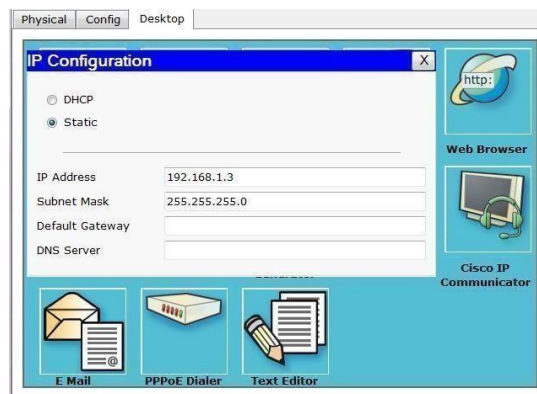

Now let's configure a WEB server in Packet Tracer.

Shikhaa Shah
(12302040701165)

Select PC0 to view configuration window

Set the PC0 IP address click on it and go to “DESKTOP” tab and look for “IP CONFIGURATION” button it should look like this after inserting 192.168.1.3 the subnet mask will select itself.

Click on Server0 to view configuration window

Set the Server0 IP address click on it and go to “DESKTOP” Tab and look for “IP CONFIGURATION” button it should look like this after inserting 192.168.1.2 the subnet mask will select itself

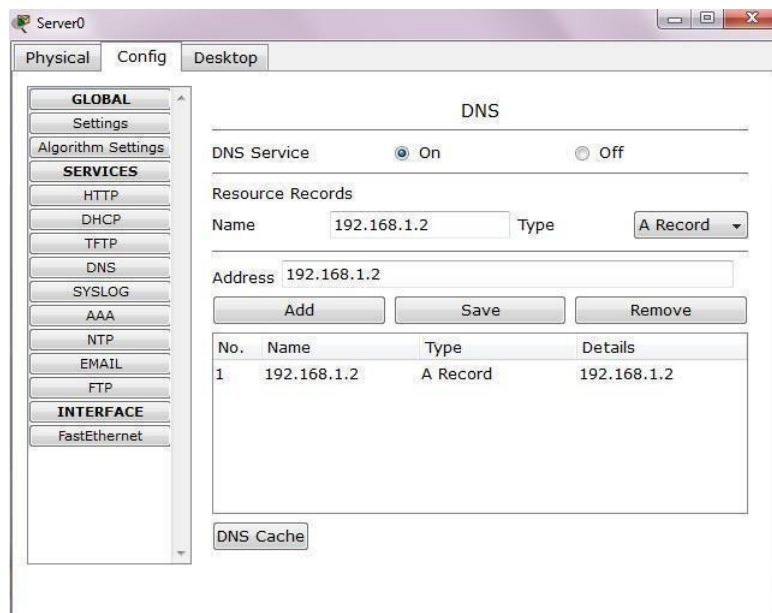

Configure HTTP Service on Server

Select HTTP service, Select http service on, Select file name and file content in HTML Code.

202044501 - COMPUTER NETWORKS

Click Server0 and go to “CONFIG” tab. Look for “DNS” , set the “Name” into whatever you wish, but if you don't own a domain name just use the same ip address like me is “192.168.1.2”.

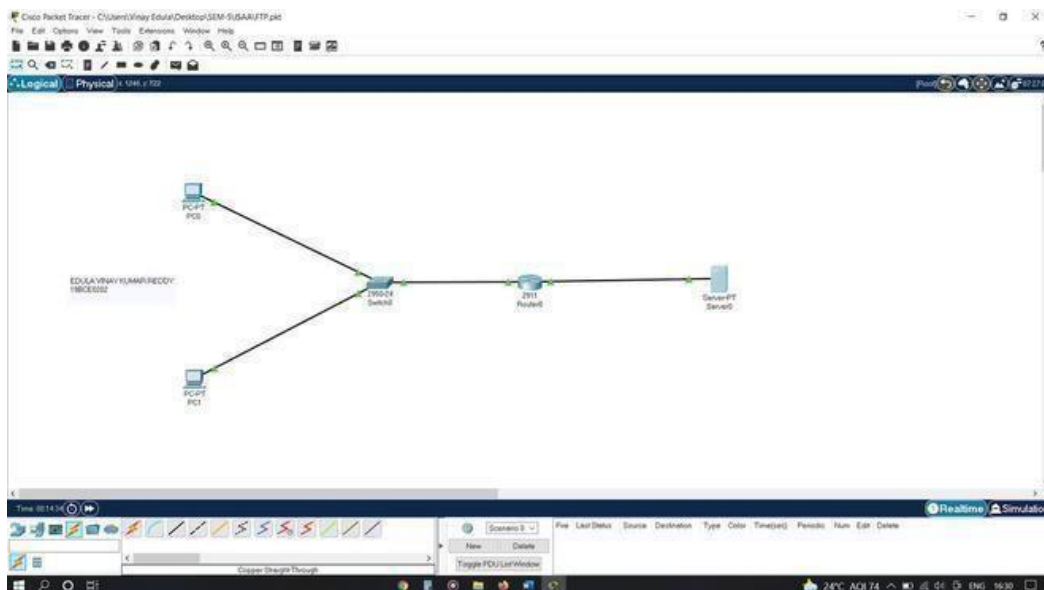

click the PC and then go to “DESKTOP” tab then choose “WEB BROWSER”. On url box , type the server IP (192.168.1.2) an IP that is given for server.

202044501 - COMPUTER NETWORKS

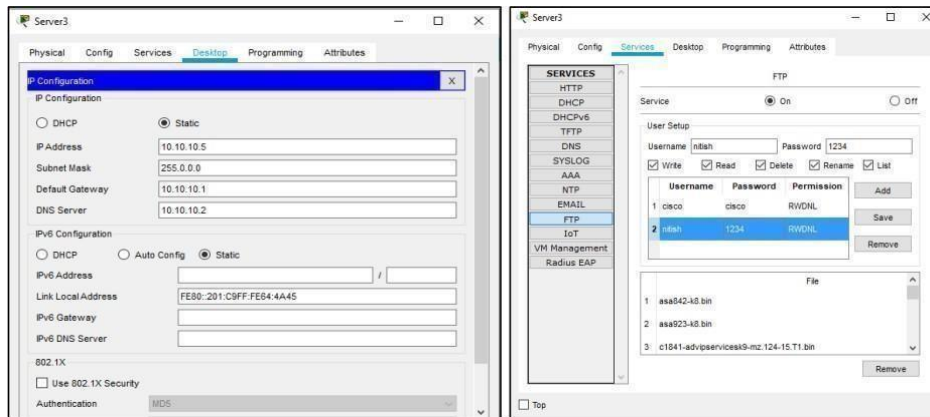

Now let's configure a FTP server in CISCO Packet Tracer.

Objectives:

- To Configure FTP Services on Server.
- To Upload a File into the FTP Server from Remote PC.

Creating a file named 2.txt for writing(uploading) into FTP Server.

Writing(uploading) the file named 2.txt into FTP Server from PC0 using put 2.txt command and verifying this file transfer using dir command.

202044501 -COMPUTER NETWORKS

Reading(Downloading) the file named 2.txt present in FTP Server from PC1 using get 2.txt command verifying this

[illegible]

AIM:- Examine Network Address Translation (NAT) in CISCO packet tracer.

Examine NAT processes as traffic traverses a NAT border router. Background /

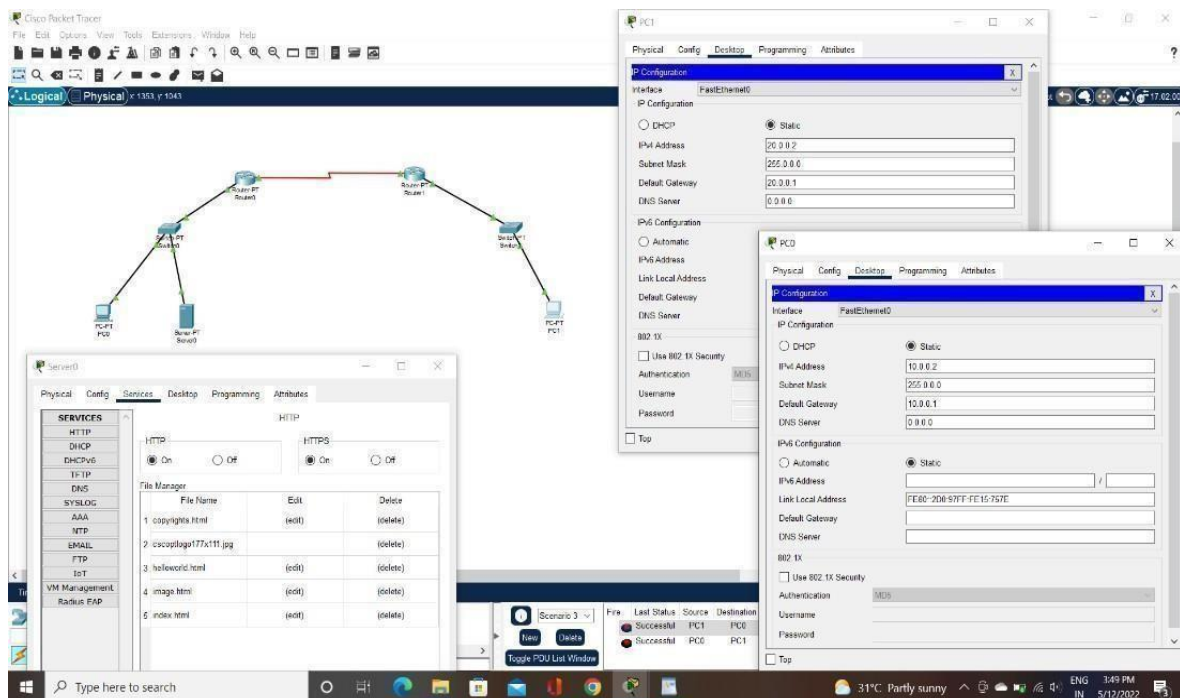

Preparation

In this activity, you will use Packet Tracer Simulation mode to examine the contents of the IP header as traffic crosses the NAT border router.

Shikhaa Shah
(12302040701165)

Assign IP address to pc.

202044501 - COMPUTER NETWORKS

Assign IP address in FastEthernet0/0 of both routers.

The image shows a Cisco Packet Tracer simulation environment. On the left, a network diagram displays two routers, Router0 and Router1, connected by a serial link. Router0 is connected to two PCs (PC0 and PC1), and Router1 is connected to two PCs (PC2 and PC3). On the right, the configuration windows for both routers are open. For Router0, the FastEthernet0/0 interface is configured with IP address 10.0.0.1 and subnet mask 255.0.0.0. For Router1, the FastEthernet0/0 interface is configured with IP address 20.0.0.1 and subnet mask 255.0.0.0. The bottom status bar shows the time as 10:34:14 and the scenario as Scenario 3.

Assign IP address in Serial2/0 of both routers.

Later on type the NAT commands in the CLI of both the routers.

```
Router(config-if)#exit
Router(config)#ip nat inside source static 10.0.0.2 50.0.0.2
Router(config)#ip nat inside source static 10.0.0.3 50.0.0.3
Router(config)#
Router(config)#
Router(config)#interface FastEthernet0/0
Router(config-if)#ip nat inside
Router(config-if)#exit
Router(config)#
Router(config)#
Router(config)#interface FastEthernet0/0
Router(config-if)#
Router(config-if)#exit
Router(config)#interface FastEthernet1/0
Router(config-if)#ip nat inside
Router(config-if)#exit
Router(config)#
Router(config)#
Router(config)#interface FastEthernet1/0
Router(config-if)#
Router(config-if)#exit
Router(config)#interface Serial2/0
Router(config-if)#ip nat outside
Router(config-if)#exit
Router(config)#
```

The image shows a Cisco Packet Tracer simulation environment. On the left, a network diagram displays two routers, Router0 and Router1, connected by a serial link. Router0 is connected to two PCs (PC0 and PC1), and Router1 is connected to two PCs (PC2 and PC3). On the right, the configuration windows for both routers are open. For Router0, the Serial2/0 interface is configured with IP address 10.0.0.1 and subnet mask 255.0.0.0. For Router1, the Serial2/0 interface is configured with IP address 20.0.0.1 and subnet mask 255.0.0.0. The bottom status bar shows the time as 10:41:16 and the scenario as Scenario 3.

PRACTICAL – 9

AIM:- Introduction to packet capturing using Wireshark.

- Packet capturing

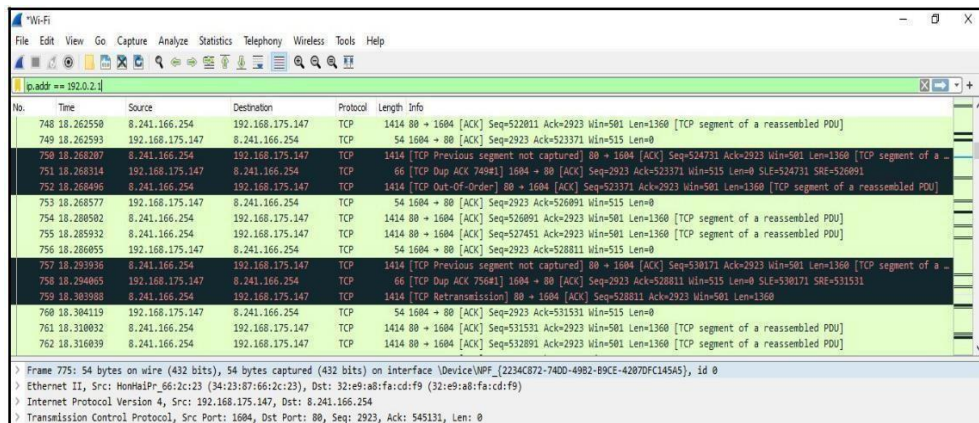

Packet Capture is a networking term for intercepting a data packet that is crossing a specific point in a data network.

Once a packet is captured in real-time, it is stored for a period of time so that it can be analyzed, and then either be downloaded, archived or discarded.

A packet capture tool (also called a network analyzer) can be used to capture this data for analysis.

ip.addr == 10.10.1.171:

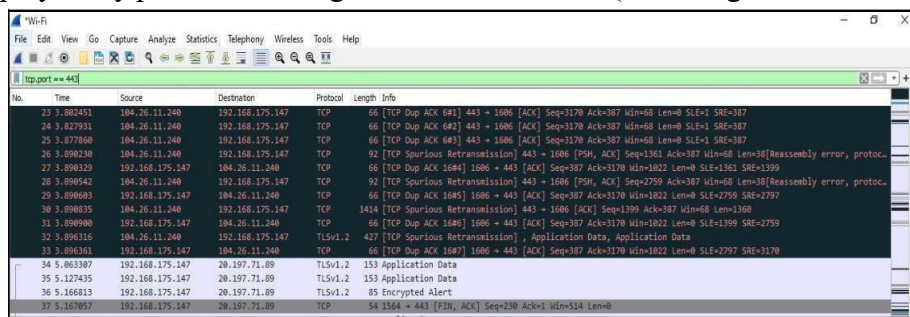

The following filter can be used to display only packets that have source or destination IP address of 10.10.1.171.

Wireshark packet capture window showing a list of captured packets. The filter bar at the top contains the filter: `ip.addr == 192.0.2.1`. The packet list shows various TCP segments and retransmissions between source IP 8.241.166.254 and destination IP 192.168.175.147.

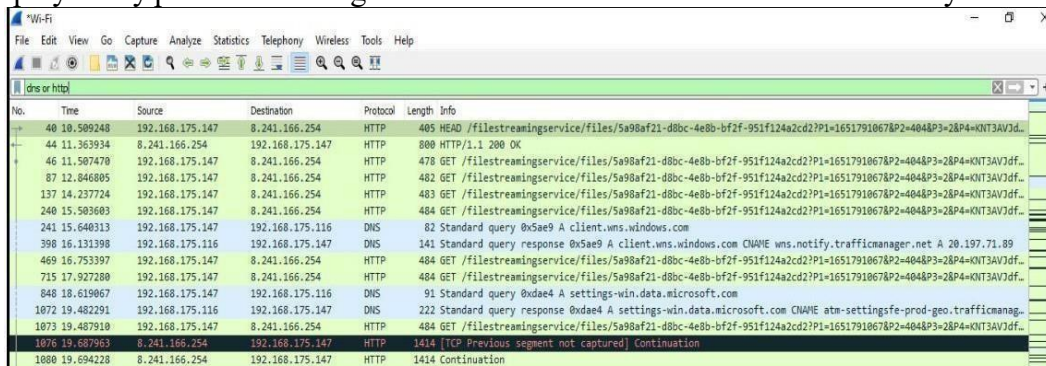

tcp.port == port number:

This filter displays only packets exchanged with a web server (assuming the web server is using

Wireshark packet capture window showing a list of captured packets. The filter bar at the top contains the filter: `tcp.port == 443`. The packet list shows TCP segments and retransmissions, including application data and encrypted alerts, all related to port 443.

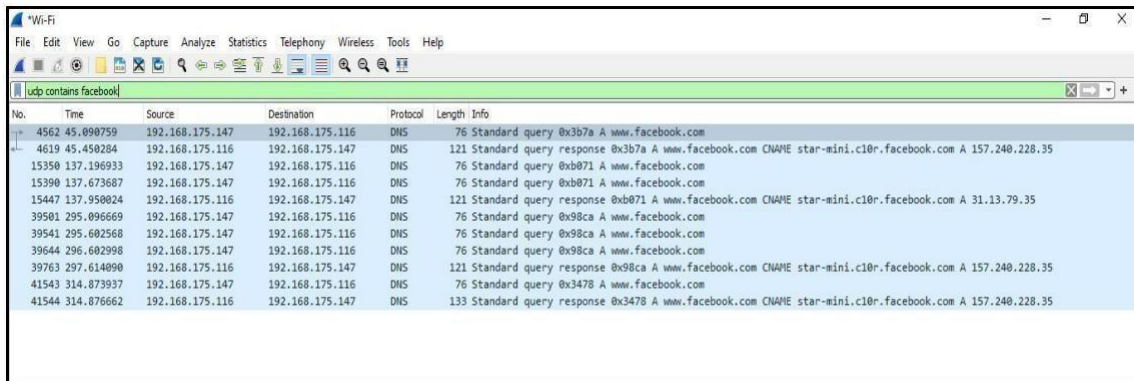

This filter displays only packets exchanged with a web server with DNS or HTTP only.

Wireshark packet capture window showing a list of captured packets. The filter bar at the top contains the filter: `dns or http`. The packet list shows a mix of HTTP requests (HEAD, GET) and DNS standard queries, all related to the specified services.

UDP:

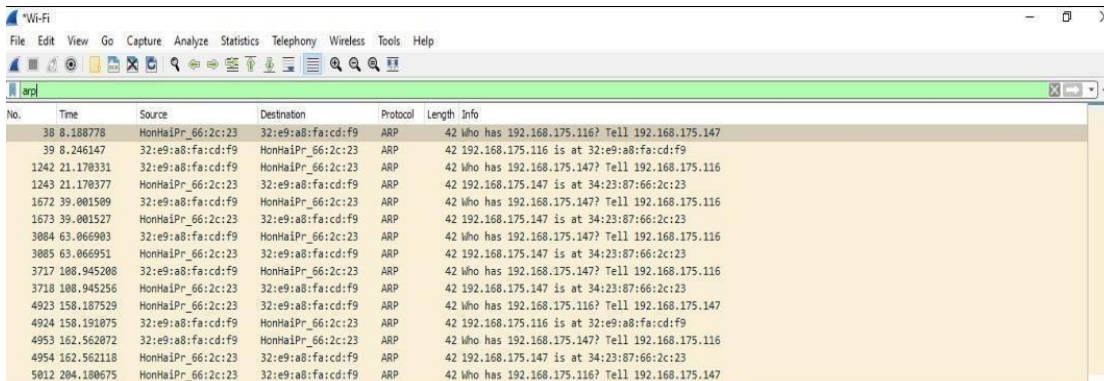

This primitive allows you to filter on UDP port number. You can optionally precede this primitive with the keywords src|dst and udp which allow you to specify that you are only interested in source or destination ports and UDP packets respectively.

No.	Time	Source	Destination	Protocol	Length	Info

ARP:

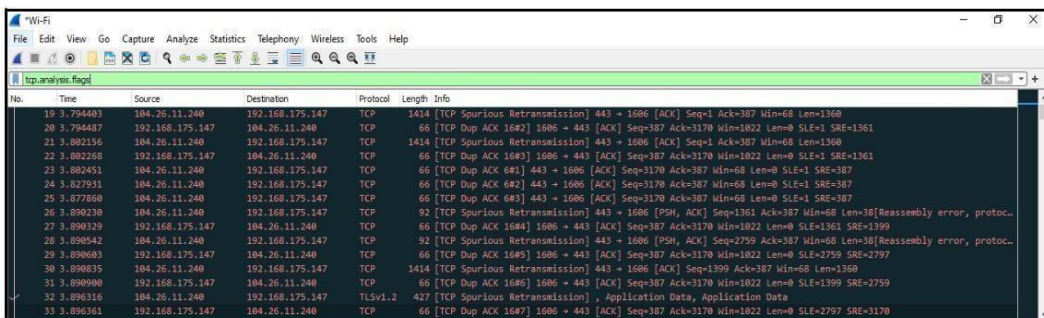

Address Resolution Protocol (ARP) is a protocol or procedure that connects an ever-changing Internet Protocol (IP) address to a fixed physical machine address, also known as a media access control (MAC) address, in a local-area network (LAN).

Tcp analysis flag:

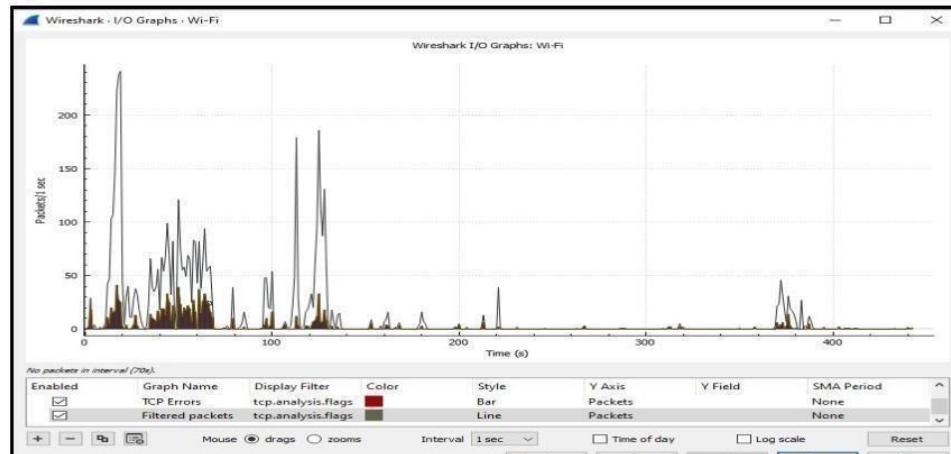

Analysis is done once for each TCP packet when a capture file is first opened. Packets are processed in the order in which they appear in the packet list. You can enable or disable this feature via the "Analyze TCP sequence numbers" TCP dissector preference.

PRACTICAL – 10

AIM:- Implement socket programming with UDP & TCP.

Code for ServerSide :

```
import java.io.*;
import java.net.*;
public class
MyServer
{
    public static void main(String[] args)
    {
        Try
        {
            ServerSocket ss=new ServerSocket(6666); Socket s=ss.accept();//establishes connection
            DataInputStream dis=new
            DataInputStream(s.getInputStream());
            String str=(String)dis.readUTF();
            System.out.println("message= "+str); ss.close();
        }
        catch(Exception e)
        {
            System.out.println(e);
        }
    }
}
```

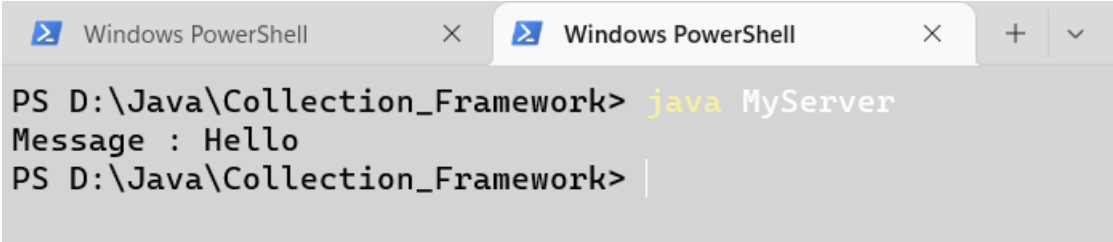

Code For ClientSide :

```
import java.io.*;
import java.net.*;
public class
MyServer
{
    public static void main(String[] args)
    {
        try
        {ServerSocket ss=new ServerSocket(6666); Socket s=ss.accept();//establishes
        connection
        DataInputStream dis=new
        DataInputStream(s.getInputStream()); String str=(String)dis.readUTF();
        System.out.println("message= "+str); ss.close();
        }
        catch(Exception e)
```

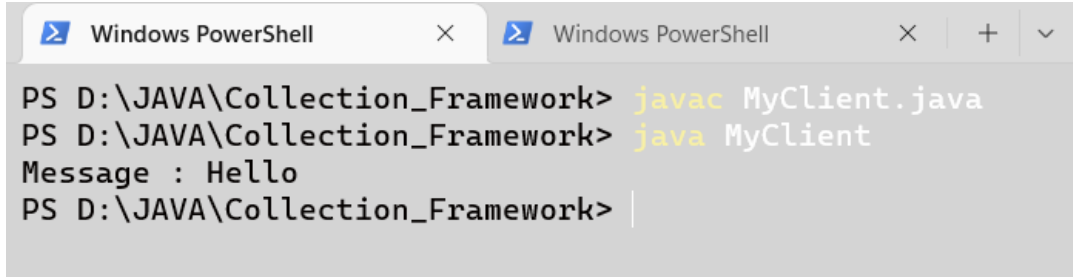

202044501 - COMPUTER NETWORKS

```
{  
System.out.println(e);  
}  
}  
}
```

OUTPUT:

```
PS D:\Java\Collection_Framework> java MyServer  
Message : Hello  
PS D:\Java\Collection_Framework> |
```

```
PS D:\JAVA\Collection_Framework> javac MyClient.java  
PS D:\JAVA\Collection_Framework> java MyClient  
Message : Hello  
PS D:\JAVA\Collection_Framework> |
```
